

Injuries among Children and Young Adults remain major morbidity and mortality causes worldwide. While actual extent of the problem remains unclear, urgent action is needed to stay the growing burden among children and young adults. Indeed the global community has come a long way in recognizing the problem as an important agenda item, and drumming support for intra-country and international responses. However, such commitments are yet to be better coordinated across nations, sectors and agencies if they are to result into tangible safety dividends for households. While, the age long competition from other important health priorities continues to disadvantage national commitments to child safety and welfare, especially in the least resourced countries, it needs to be managed in such a way as to optimize resources and maximize benefits of synergy and concert.
